

HEPATITIS

Hepatitis C is a liver infection caused by the hepatitis C virus (HCV). Although hepatitis C has been around for many years, scientists only recently found a test for antibodies to the virus. Most people with hepatitis C experience loss of appetite, tiredness, nausea, vomiting, abdominal pain, jaundice, itchy skin, dark urine or light coloured stool. HCV may lead to liver damage, cirrhosis and liver cancer.

Medications Called **Interferon** And **Ribavirin** Can Be Used To Treat Hepatitis C.

BLOOD TO BLOOD

YOU MAY NOT HAVE ANY SYMPTOMS SO, GET TESTED!

- Litching
- Depression
- Anemia
- Fatigue
- No Appetite
- Mouth Sores
- Hair loss
- Rash
- Nagging Cough
- Nausea
- Dry Skin
